

Rhombus Opposite Angles Theorem

Examples & Non-Examples

Example	Example	Non-Example
		

Statement

In a rhombus, opposite angles are congruent (equal in measure).

In simple terms:

The angles that face each other in a rhombus are the same.

Example:

In rhombus $ABCD$, $\angle A = \angle C$ and $\angle B = \angle D$.

Why It Matters:

This property helps in calculating unknown angles and proving a quadrilateral is a rhombus.
