|  A diagram showing an acute angle of 60°. Two rays share a common vertex. One ray is horizontal and points to the right. The other ray points up and to the right. A blue arc indicates the angle, with the label "60°" in blue. A red arrow points to the degree symbol. |  A diagram showing an obtuse angle of 135°. Two rays share a common vertex. One ray is horizontal and points to the right. The other ray points up and to the left. A blue arc indicates the angle, with the label "135°" in blue. A red arrow points to the degree symbol. | It's 12 <b>degrees</b> fahrenheit outside. That's cold! |

## Definition

**Degrees** are a unit of measurement used to describe the **size of an angle**.

A full circle is divided into 360 **degrees (°)**, so degrees tell us how much one ray has turned away from another around a common vertex.
