

# Quadrilateral

## Examples & Non-Examples

Example	Example	Non-Example
		

## Definition

A polygon with four sides and four vertices.

## In simple terms:

Any shape that has four straight sides and four corners.

## Example:

Squares, rectangles, trapezoids, rhombuses, and parallelograms are all quadrilaterals.

## Important Notes:

- The sum of the interior angles of any quadrilateral is  $360^\circ$ .
- Quadrilaterals can be classified by their sides and angles (e.g., parallelogram, rectangle, rhombus, square, trapezoid).
