

Rhombus

Examples & Non-Examples

Example	Example	Non-Example
		

Definition

A parallelogram with all four sides congruent (equal in length).

In simple terms:

A four-sided shape where every side is the same length.

Example:

A diamond shape on a playing card is a rhombus.

Important Notes:

- Opposite sides are parallel.
- Opposite angles are congruent.
- Diagonals bisect each other at right angles (90°).
- Diagonals bisect the angles of the rhombus.
- All properties of parallelograms also apply.
